

My Experience Creating a Website

Several weeks ago, I made a personal portfolio website for my school project. At first, I felt confused because I did not really understand how to make a website. However, I was excited to learn new things about web design and coding.

First, I planned the design of the website. I chose a modern and simple theme with purple colors and several sections such as Home, About, Skills, Projects, and Contact. After that, I started writing the code using HTML, CSS, Bootstrap, and a little JavaScript.

During the process, I faced some problems. For example, the navbar did not work properly and some images looked messy on the screen. I tried to fix the problems by changing the CSS code and arranging the layout again. Sometimes I felt tired, but I kept trying until the website looked better.

After finishing the design, I added animations, buttons, and responsive features so the website could be opened on both desktop and mobile devices. Finally, the website was completed successfully.

In the end, I felt very happy and proud because I could create my own website. From this experience, I learned many new things about coding, creativity, and problem solving.
